## Technical Data

### Hydraulic fluid

We request that before starting a project detailed information about the choice of pressure fluids and application conditions are taken from our catalogue sheets RA 90220 (petroleum oil), RA 90221 (environmentally acceptable hydraulic fluids) and RA 90223 (fire resistance fluids, HF).

When using HF- or environmentally acceptable hydraulic fluids possible limitations for the technical data have to be taken into consideration. If necessary please consult us or your fluid supplier (please indicate type of the hydraulic fluid used for your application on the order sheet).

### Operating viscosity range

In order to obtain optimum efficiency and service life, we recommend that the operating viscosity (at operating temperature) be selected from within the range:

Optimum operating viscosity ( $v_{opt}$ )...80-170 SUS (16...36 mm<sup>2</sup>/s)

referred to the loop temperature (closed circuit) or reservoir temperature (open circuit).

### Viscosity limits

The limiting values for viscosity are as follows:

#### Sizes 28...200

$$v_{min} = 42 \text{ SUS (5 mm}^2/\text{s)}$$

short term at a max. permissible temp. of  $t_{max} = 240^\circ\text{F (115°C)}$

$$v_{max} = 7400 \text{ SUS (1600 mm}^2/\text{s)}$$

short term on cold start ( $t_{min} = -40^\circ\text{F/-40°C}$ )

#### Sizes 250...1000

$$v_{min} = 60 \text{ SUS (10 mm}^2/\text{s)}$$

short term at a max. permissible leakage oil temperature of  $t_{max} = 195^\circ\text{F (90°C)}$

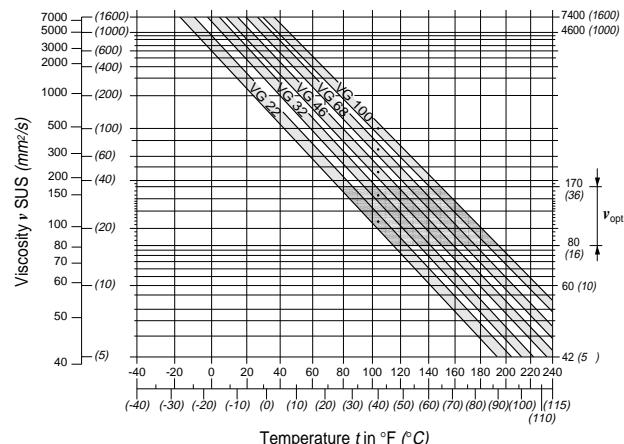

$$v_{max} = 4600 \text{ SUS (1000 mm}^2/\text{s)}$$

short term on cold start ( $t_{min} = -13^\circ\text{F/-25°C}$ )

Please note that the max. fluid temperature is also not exceeded in certain areas (for instance bearing area).

At temperatures of  $-13^\circ\text{F}$  up to  $-40^\circ\text{F}$  ( $-25^\circ\text{C}$  up to  $-40^\circ\text{C}$ ) special measures may be required for certain installation positions. Please contact us for further information.

### Selection diagram

### Notes on the selection of the hydraulic fluid

In order to select the correct fluid, it is necessary to know the operating temperature in the loop (closed circuit) or the reservoir temperature (open circuit) in relation to the ambient temperature.

The hydraulic fluid should be selected so that within the operating temperature range, the operating viscosity lies within the optimum range ( $v_{opt}$ ) (see shaded section of the selection diagram). We recommend that the highest possible viscosity range should be chosen in each case.

Example: At an ambient temperature of  $X^\circ$  the operating temperature (closed circuit: loop temperature; open circuit: reservoir temperature) is  $140^\circ\text{F (60°C)}$ . Within the optimum operating viscosity range ( $v_{opt}$ ; shaded area), this corresponds to viscosity grades VG 46 or VG 68. VG 68 should be selected.

Important: The leakage oil (case drain oil) temperature is influenced by pressure and motor speed and is always higher than the circuit temperature or the reservoir temperature. However, at no point in the system may the temperature exceed  $240^\circ\text{F (115°C)}$  for sizes 28...200 or  $195^\circ\text{F (90°C)}$  for sizes 250...1000.

If it is not possible to comply with the above condition because of extreme operating parameters or high ambient temperatures we recommend housing flushing via port U or use of a flushing valve (see page 5). Please consult us.

### Filtration

The finer the filtration the better the achieved purity grade of the pressure fluid and the longer the life of the axial piston unit. To ensure the functioning of the axial piston unit a minimum purity grade of:

9 to NAS 1638

6 to SAE

18/15 to ISO/DIS 4406 is necessary.

At very high temperatures of the hydraulic fluid

( $195^\circ\text{F}$  to max.  $240^\circ\text{F / 90°C}$  to max.  $115^\circ\text{C}$ , not perm. for sizes 250...1000) at least cleanless class

8 to NAS 1638

5 to SAE

17/14 to ISO/DIS 4406 is necessary.

If above mentioned grades cannot be maintained please consult us.

### Direction of flow

clockwise rotation	counter-clockwise rotation
A to B	B to A

### Speed range

There is no limitation on minimum speed  $n_{min}$ . If uniformity of rotation is required, however, speed  $n_{min}$  should not be allowed to fall below 50 rpm. See table on page 6 for max. permissible speeds.

### Installation position

Optional. The motor housing must be filled with fluid prior the commissioning, and must remain full whenever it is operating.

For extensive information on installation position, please consult our data sheet RA 90 270 before completing your design work.

## Variable Displacement Motor AA6VM (A6VM)

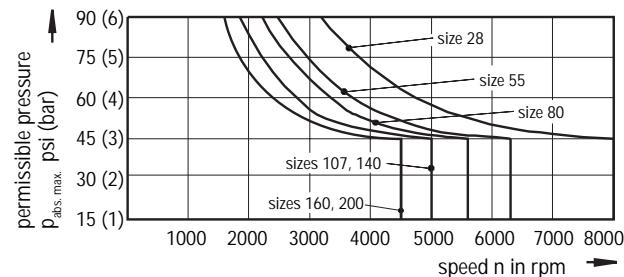

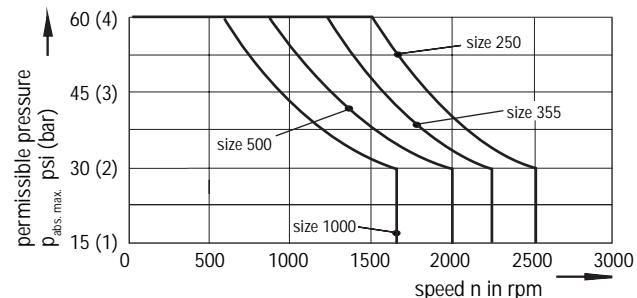

**Technical Data****Case drain pressure**

Shaft seal ring FPM (fluor-caoutchouc)

The lower the speed and the case drain pressure the higher the life expectation of the shaft seal ring.

The values shown in the diagram are permissible loads of the seal ring and shall not be exceeded.

At stationary pressure loads in the range of the max. admissible leakage pressure a reduction of the life experience of the seal ring will result.

For a short period ( $t < 5$  min.) pressure loads up to 75 psi (5 bar) independent from rotational speeds are permissible respectively for sizes 28...200.**Sizes 28...200****Sizes 250...1000**

Special operation conditions may require limitations of these values.

**Note:**

- max. permissible motor speeds are given in the table on page 6.

- max. permissible housing pressure

sizes 28...200:  $P_{abs.\max} = 90$  psi (6 bar)sizes 250...1000:  $P_{abs.\max} = 60$  psi (4 bar)

The pressure in the housing must be the same as or greater than the external pressure on the shaft seal.

**Long-life bearings (sizes 250...1000)**

For long service life and HF fluids.

**Special features:**

The external dimensions of the axial piston pump do not vary from the standard.

The long-life bearing set may be subsequently built into available axial piston pumps.

The drain case port must always be open.

It is recommended that the bearings are flushed via port U.

**Flushing and boost pressure valve**

The flushing and boost pressure valve (closed circuits) is set at a fixed pressure of 230 psi (16 bar) and serves to maintain the minimum boost pressure (set primary valve accordingly). Dependend on the control device and motor size, the valve is mounted onto the variable motor or integrated in the control device (see page 35).

A quantity of hydraulic fluid, determined by the orifice fitted, is drawn off from the low pressure side and passed into the motor housing, from where it is led off to reservoir together with the leakage fluid. The fluid thus taken from the circuit must be replaced with cooled oil by means of the boost pump.

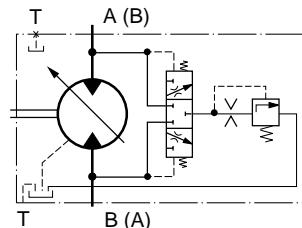

Different flushing volumes can be selected by means of orifices.

**Flow \* (for low pressure  $\Delta p = 365$  psi/25 bar)**

Size	Volume	Orifice-No.
28, 55	0.9 gpm (3.5 L/min)	09651766/503.12.01.01
80	1.3 gpm (5 L/min)	09419695/503.12.01.01
107	2.1 gpm (8 L/min)	09419696/503.12.01.01
160, 200	2.6 gpm (10 L/min)	09419697/503.12.01.01
250	2.6 gpm (10 L/min)	
355	4.2 gpm (16 L/min)	
500	5.3 gpm (20 L/min)	
1000	6.6 gpm (25 L/min)	

**\* Standard flushing volumes**

(for sizes 28...200 flushing volumes of 0.9 - 2.6 gpm (3.5 - 10 L/min) can be supplied. If a flushing volume different from the standard flushing volume is required, please indicate the requested orifice in clear text when ordering.)

**Operating pressure range**Maximum pressure at port A or B  
(Pressure data to DIN 24312)**Sizes 28...200**Nominal pressure  $p_N$  5800 psi (400 bar)\*Peak pressure  $p_{\max}$  6525 psi (450 bar)\*\*) size 80:  $p_N = 5100$  psi (350 bar),  $p_{\max} = 5800$  psi (400 bar)Attention: shaft end Z and S with drives of radial force loads at the drive shaft (pinion V-belt drives) necessitate reduction of the nominal pressure to  $p_N = 4570$  psi (315 bar), size 80:  $p_N = 2900$  psi (200 bar). Please contact us.**Sizes 250...1000**Nominal pressure  $p_N$  5100 psi (350 bar)Peak pressure  $p_{\max}$  5800 psi (400 bar)

With pulsating loads above 4570 psi (315 bar) we recommend using the model with splined shaft (sizes 250...1000).

The sum of the pressures at ports A and B may not exceed 10000 psi (700 bar).

<sup>1)</sup> Axial piston unit in stationary or in bypass operation, please contact us when appearing higher forces!

<sup>2)</sup> Please contact us!

**Code explanation**

**a** = distance of  $F_q$  from shaft shoulder

The direction of the max. axial force must be noted by sizes 28...200

$F_{q \max}$  = max. perm. radial force at distance a (at intermittent operation)

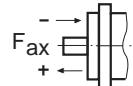

-  $F_{ax \max}$  = increased bearing life

$\pm F_{ax \max}$  = max. perm. axial force when stationary or when axial piston unit is running at zero pressure

+  $F_{ax \max}$  = reduced bearing life (avoid if possible)

$\pm F_{ax \text{ perm.}}$ /psi = perm. axial force/psi operating pressure

$\pm F_{ax \text{ perm.}}$ /bar = perm. axial force/bar operating pressure

**Speed sensor ( D )**

Version AA6VM (A6VM)...D ("with provisions for speed sensor") includes toothed collar on the rotary group.

A speed-proportional signal is produced by means of the rotating, toothed rotary group which can be picked up by a suitable sensor and fed back for evaluation.

The speed sensor can be screwed into the upper drain port. An additional adapter piece (included in supply) is necessary for the drain ports sizes 55-200 in order to install the speed sensors (thread metric M18x1,5).

Size	28	55	80	107	140	160	200
no. of teeth	42	54	58	67	72	75	80

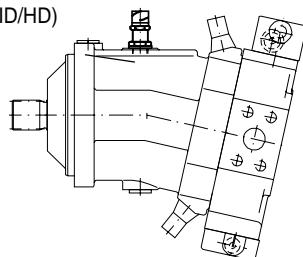

The speed sensor is not included in standard supply;

Suitable sensors:

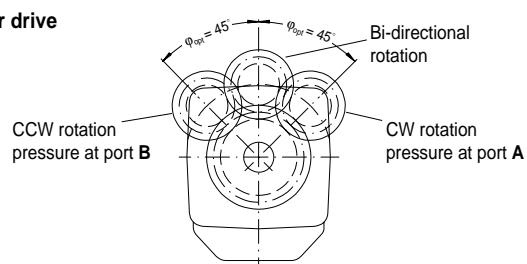

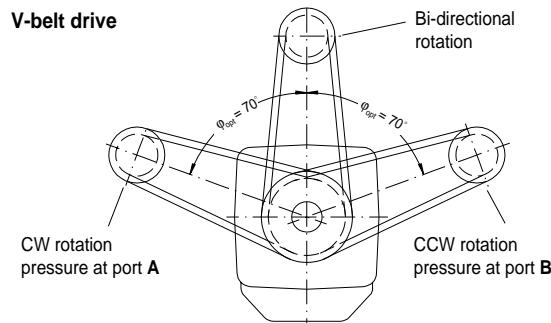

- Inductive impulse detector ID (see RA 95038)

- Hall effect speed sensor HD (see RA 95042);  
order separately!

speed sensor (ID/HD)

**Optimal force direction of  $F_q$  (valid for sizes 28...200)**

By means of appropriate force directions of  $F_q$  the bearing load caused by inside rotary group forces can be reduced. An optimal life expectation of the bearing can be reached.

**Gear drive****V-belt drive**

## HD Hydraulic Control, Pilot Pressure Related

The pilot pressure related hydraulic control allows infinite variation of the motor displacement in relation to a pilot pressure signal. The control function is proportional to the pilot pressure applied at port X.

### HD1 Pilot pressure increase 145 psi (10 bar)

- sizes 28...200 ( $V_{g \min} = 0$  to  $V_{g \max}$ )  $\Delta p_s = 145$  psi (10 bar)
- sizes 250...1000 ( $V_{g \min} = 0,2 V_{g \max}$  to  $V_{g \max}$ )  $\Delta p_s = 145$  psi (10 bar)

Start of control, setting range:

- sizes 28...1000 30 - 290 psi (2 - 20 bar)

Standard setting: start of control at 45 psi (3 bar)  
end of control at 190 psi (13 bar)

### HD2 Pilot pressure increase 365 psi (25 bar)

- sizes 28...200 ( $V_{g \min} = 0$  to  $V_{g \max}$ )  $\Delta p_s = 365$  psi (25 bar)
- sizes 250...1000 ( $V_{g \min} = 0,2 V_{g \max}$  to  $V_{g \max}$ )  $\Delta p_s = 365$  psi (25 bar)

Start of control, setting range:

- sizes 28...1000 75 - 725 psi (5 - 50 bar)

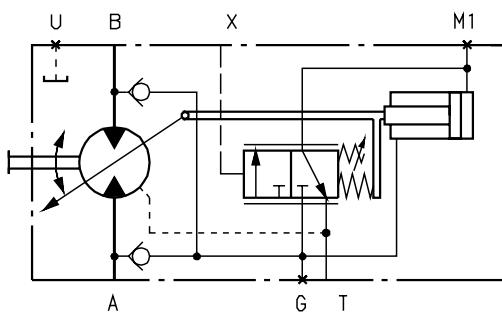

Standard setting: start of control at 145 psi (10 bar)  
end of control at 510 psi (35 bar)

When ordering please state required start of control in clear text,  
e.g. start of control at 45 psi (3 bar).

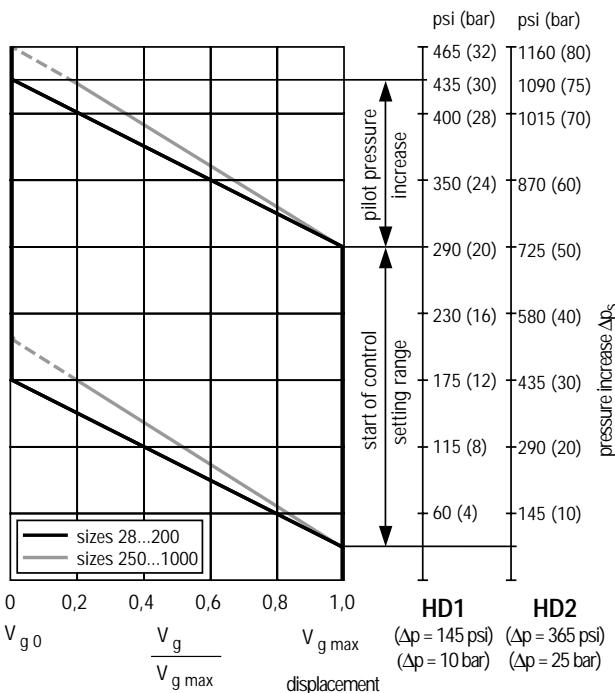

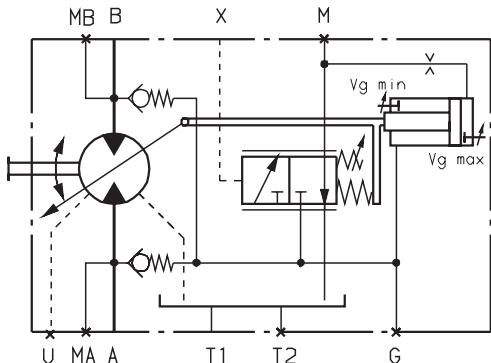

#### Circuit diagram:

#### Hydraulic control, pilot pressure related HD1, HD2

Sizes 28...200

Sizes 250...1000

Standard version:

- start of control at  $V_{g \max}$  (max. torque, min. speed)
- end of control at  $V_{g \min}$  (min. torque, max. perm. speed)

Max. perm. pilot pressure 1450 psi (100 bar)

Because of internal leakage, there is a leakage flow of approx. 0.08 gpm (0.3 L/min.) at port X.

To prevent an influence on the characteristic, leakage flow has to be led into the tank through the control device.

Unit dimensions control HD, see page 22...32

## Variable Displacement Motor AA6VM (A6VM)

**Variation: Constant pressure control (HD.D)**

The constant pressure control is superimposed on the HD function. Should system pressure rise as a result of the load torque or reduction of the motor swivel angle, when the setting of the constant pressure control is reached the motor is swivelled out to a higher angle.

As a result of the increased displacement and consequent pressure reduction, the control deviation is eliminated. By increasing the displacement the motor produces a higher torque at a constant pressure.

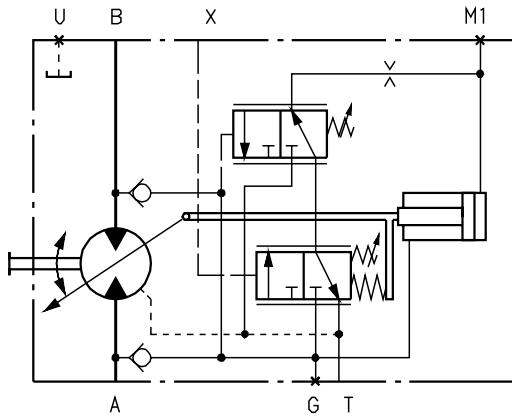

Setting range of constant pressure control valve:

sizes 28...200 1160 - 5800 psi (80 - 400 bar)  
 sizes 250...1000 1160 - 5100 psi (80 - 350 bar)

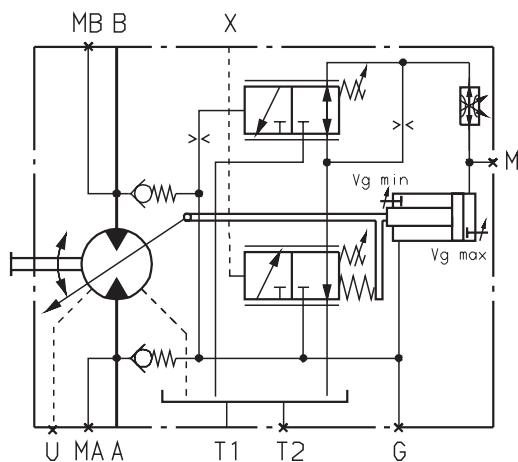

**Circuit diagram:**

*Hydraulic control, pilot pressure related,  
 with constant pressure control HD1D, HD2D*

Sizes 28...200

Sizes 250...1000

**Variation: Remote constant pressure control (HD.G)**

The remote pressure control controls the motor when reaching the set pressure command signal continuously until it reaches the max. displacement  $V_g \text{ max}$ . A pressure relief valve (not supplied), which is separate to the motor, is responsible for the control of the internal pressure cut-off valve. As long as the pressure command signal has not been obtained, the valve is, in addition to the spring force, pressurised from both sides, and is held closed. The pressure command signal is between 1160 and 5100 psi (80 bar and 350 bar). On reaching the pressure command signal at the separate pressure relief valve, this opens, whereby the pressure on the spring side is allowed to flow to tank. The internal pilot valve operates and the motor swivels to maximum displacement  $V_g \text{ max}$ . The pressure difference at the pilot valve is set as standard to 365 psi (25 bar). We recommend the following as a separate pressure relief valve:

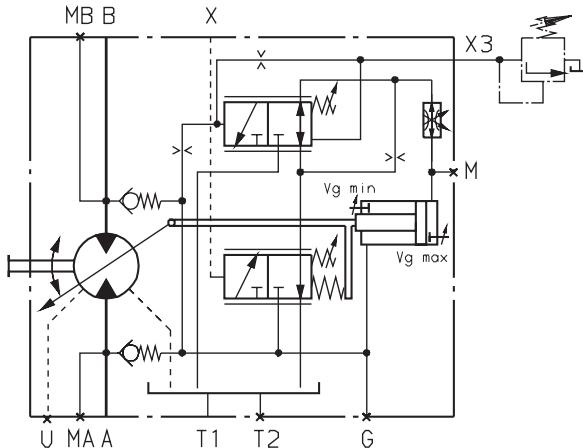

DBD 6 (hydraulic) to RA 25402

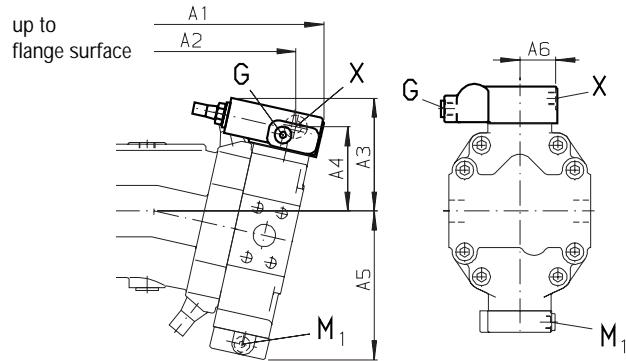

The max. line length should not exceed 6 ft (2 m).

## HZ Hydraulic Two-Position Control

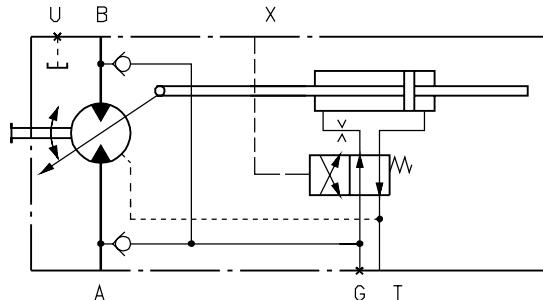

The hydraulic two-position control allows the displacement to be set to  $V_{g \min}$  or  $V_{g \max}$  by applying or venting pilot pressure at port X.

Standard version:

- start of control at  $V_{g \max}$  (max. torque, min. speed)
- end of control at  $V_{g \min}$  (min. torque, max. perm. speed)

### Standard version:

- start of control at  $V_g$  max (max. torque, min. speed)
- end of control at  $V_g$  min (min. torque, max. perm. speed)

Adjustment of the control speed or limiting of the displacement (limiting of swivel) range by electrical means is possible using the following control devices:

Proportional amplifier PV \_\_\_\_\_ see RA 95023

Chopper amplifier CV \_\_\_\_\_ see RA 95029

Electrical amplifier 2014/15 \_\_\_\_\_ see RA 95027

Electrical amplifier VT 2000, series 5 \_\_\_\_\_ see RA 29904

## Variable Displacement Motor AA6VM (A6VM)

**Variation: Direct constant pressure control (EP.D)**

The constant pressure control is superimposed on the EP function. Should system pressure rise as a result of the load torque or reduction of the motor swivel angle, when the setting of the constant pressure control is reached the motor is swivelled out to a higher angle.

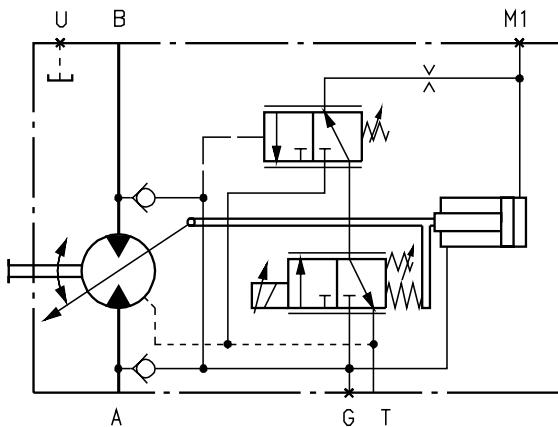

As a result of the increased displacement and consequent pressure reduction, the control deviation is eliminated. By increasing the displacement the motor produces a higher torque at a constant pressure.

Setting range of constant pressure control valve:

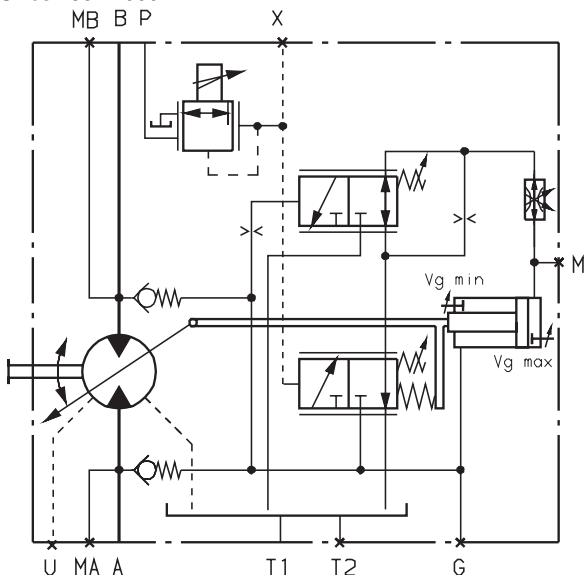

Sizes 28...200 1160 - 5800 psi (80 - 400 bar)  
 Sizes 250...1000 1160 - 5100 psi (80 - 350 bar)

**Circuit diagram:*****Electrical control with proportional solenoid,  
with direct constant pressure control EP1D, EP2D***

Sizes 28...200

Sizes 250...1000

**Variation: Remote constant pressure control (EP.G)**

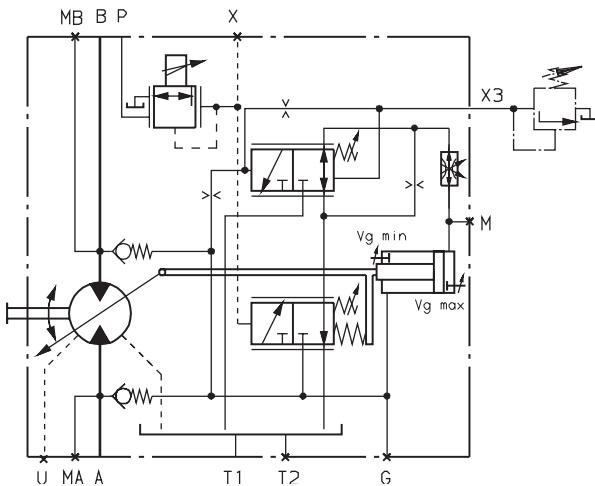

The remote pressure control controls the motor when reaching the set pressure command signal continuously until it reaches the max. displacement  $V_g \text{ max}$ . A pressure relief valve (not supplied), which is separate to the motor, is responsible for the control of the internal pressure cut-off valve. As long as the pressure command signal has not been obtained, the valve is, in addition to the spring force, pressurised from both sides, and is held closed. The pressure command signal is between 1160 psi and 5100 psi (80 bar and 350 bar). On reaching the pressure command signal at the separate pressure relief valve, this opens, whereby the pressure on the spring side is allowed to flow to tank. The internal pilot valve operates and the motor swivels to maximum displacement  $V_g \text{ max}$ . The pressure difference at the pilot valve is set as standard to 365 psi (25 bar). We recommend the following as a separate pressure relief valve:

DBD 6 (hydraulic) to RA 25402

The max. line length should not exceed 6 ft (2 m).

## DA Hydraulic Control, Speed Related

The AA6VM (A6VM) variable motor with speed related hydraulic control is particularly suitable for use in hydrostatic transmissions in conjunction with variable pump AA4VG with DA control. The swivel angle of the hydraulic motor is controlled by means of the pilot pressure determined by the input speed of the AA4VG variable pump and by the operating pressure.

An increase in the pump input speed and thus in the pilot pressure causes the motor, in relation to the existing operating pressure, to swivel towards a lower displacement volume (lower torque, higher speed).

If operating pressure should rise above the value set with the pressure control, the motor is then swivelled towards a higher displacement volume (higher torque, lower speed).

### DA (sizes 250...1000) DA1, DA4 (sizes 28...200)

#### Hydraulic valve for travel direction

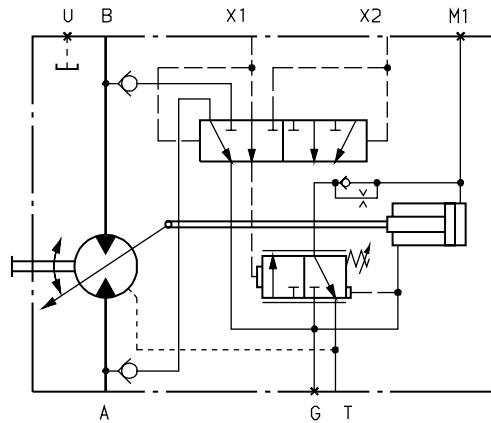

Through the control pressure  $X_1$  or  $X_2$  this valve is switched on/off dependend on the direction of rotation (travel direction)

## HA Automatic Control, High Pressure Related

With the automatic, high pressure related control, setting of the displacement is effected automatically as a function of the operating pressure.

This control device measures the operating pressure at A or B internally (no pilot line required) and swivels from  $V_g \text{ min}$  to  $V_g \text{ max}$  once the pressure setting of the control is reached.

Standard version:

start of control at  $V_g \text{ min}$  (no torque, max. perm. speed)

end of control at  $V_g \text{ max}$  (max. torque, min. speed)

### HA1

Version with virtually no pressure increase from start of control to end of control.

Pressure increase:

sizes 28...200 ( $V_g \text{ min} = 0$  to  $V_g \text{ max}$ )  $\leq \Delta p 145 \text{ psi (10 bar)}$

sizes 250...1000 ( $V_g \text{ min} = 0,2 V_g \text{ max}$  to  $V_g \text{ max}$ )  $\leq \Delta p 145 \text{ psi (10 bar)}$

Start of control, setting range :

sizes 28...200 1160 - 5100 psi (80 - 350 bar)

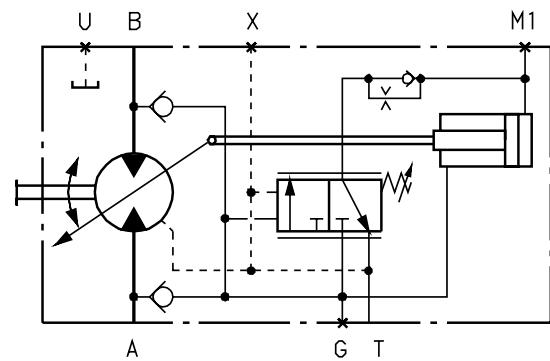

sizes 250...1000 1160 - 4900 psi (80 - 340 bar)

(state required setting in clear text when ordering)

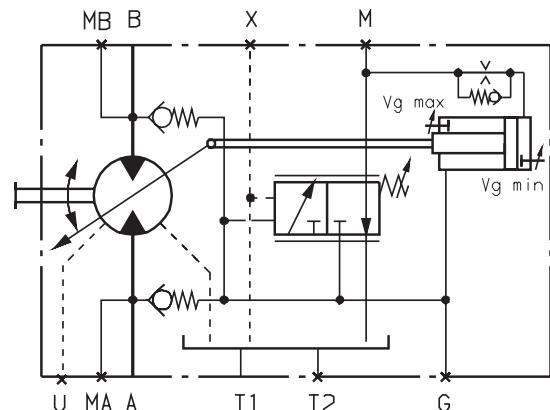

#### Circuit diagram:

#### Automatic control, high pressure related HA1

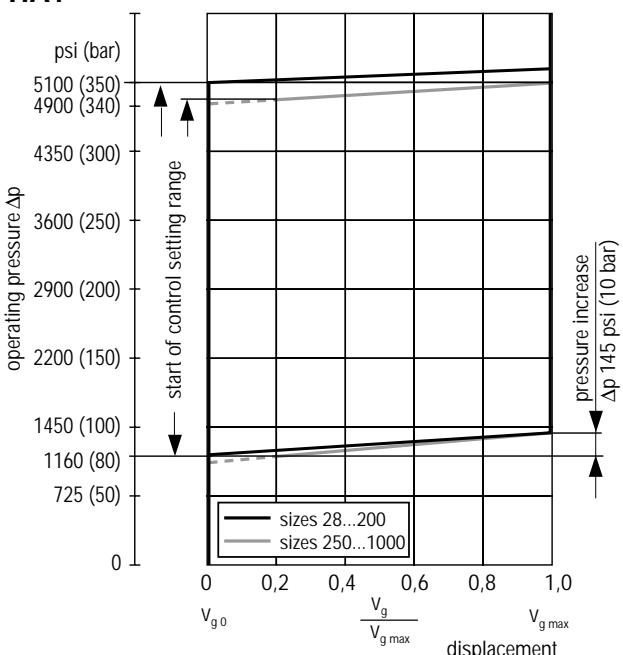

Sizes 28...200

Sizes 250...1000

### HA1

## Variable Displacement Motor AA6VM (A6VM)

**HA2**

Version with pressure increase from start of control to end of control.

Pressure increase:

sizes 28...200 ( $V_g \text{ min} = 0$  to  $V_g \text{ max}$ )  $\leq \Delta p$  1450 psi (100 bar)  
 sizes 250...1000 ( $V_g \text{ min} = 0,2 V_g \text{ max}$  to  $V_g \text{ max}$ )  $\leq \Delta p$  1450 psi (100 bar)

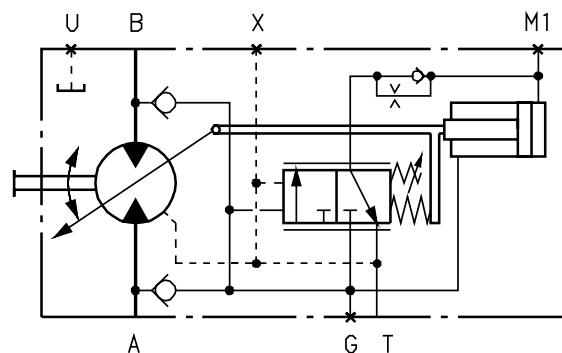

Start of control, setting range:

sizes 28...200 1160 - 5100 psi (80 - 350 bar)  
 sizes 250...1000 1160 - 3600 psi (80 - 250 bar)

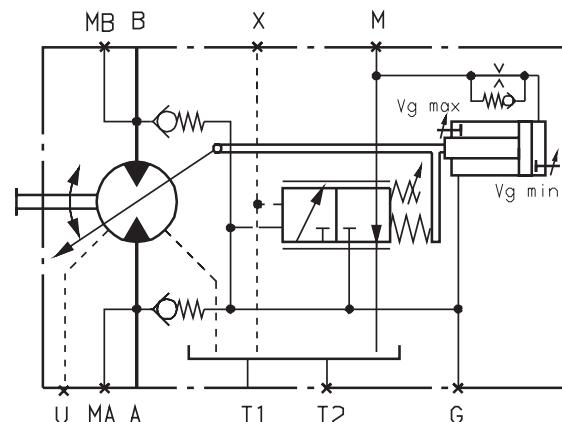

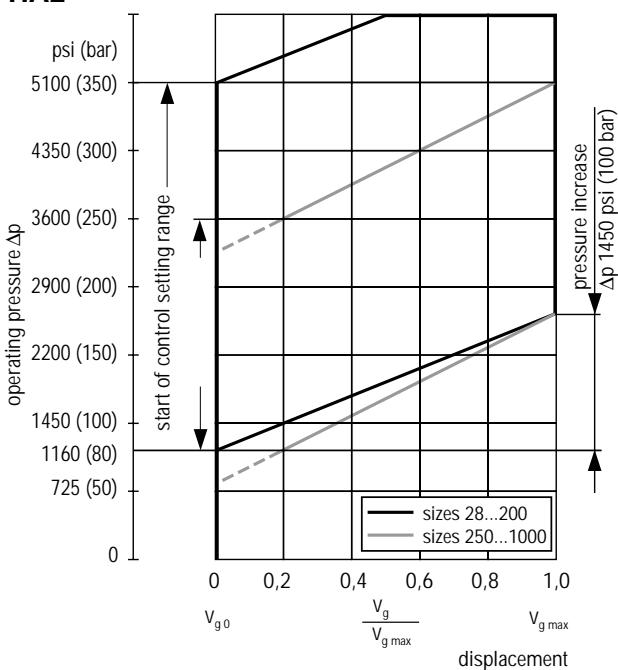

(state required setting in clear text when ordering)

**Circuit diagram:****Automatic control, high pressure related HA2**

Sizes 28...200

Sizes 250...1000

**HA2****Variation: Hydraulic override of pressure setting (HA.T)**

On versions HA1 and HA2 the pressure setting (start of control) can be influenced by applying a pilot pressure at port X.

The pressure setting is reduced by:

sizes 28...200 17 psi (17 bar)  
 sizes 250...1000 8 psi (8 bar)  
 per 1 psi (1 bar) pilot pressure.

(i.e. - Pilot pressure to high pressure ratio: 1:17)

Example (sizes 28...200):

pressure setting	4350 psi (300 bar)	4350 psi (300 bar)
pilot pressure at port X	0 psi (0 bar)	145 psi (10 bar)
start of control	4350 psi (300 bar)	1885 psi (130 bar)

If the override is only required to set the max displacement (motor swivel to  $V_g \text{ max}$ ), a pilot pressure of up to 1450 psi (100 bar) max. is permissible.

(Circuit diagram and unit dimensions see control HA1, HA2, port X open, no connection from X to T)

## Variable Displacement Motor AA6VM (A6VM)

**Variation: Electrical override of pressure setting  
(HA.U1, HA.U2)**

On versions HA1 and HA2 the high pressure related control can be overridden by means of an electrical signal to a switching solenoid. The override causes the motor to swivel to its maximum angle.

Switching solenoid de-energised  $\triangleq$  no override

Switching solenoid energised  $\triangleq$  motor set to  $V_{g \max}$

**HA.U1** switching solenoid 12 V DC, 1,6 A (min.)

**HA.U2** switching solenoid 24 V DC, 0,8 A (min.)

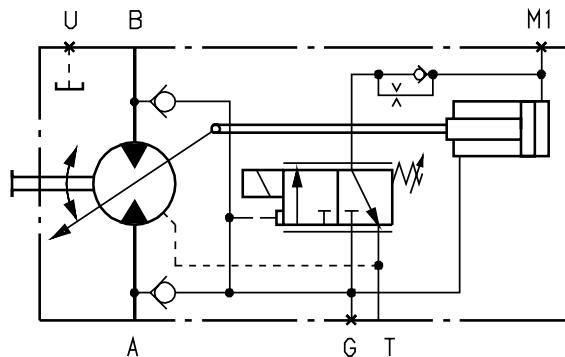

Start of control adjustable between 1160 psi and 4350 psi (80 and 300 bar)

(state required setting in clear text when ordering)

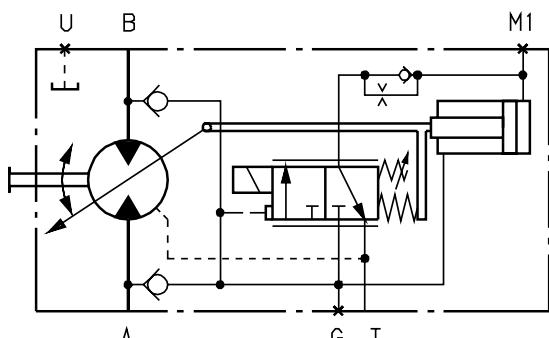

**Circuit diagram:**

**Automatic control, with electrical override HA1U1, HA1U2**

Sizes 28...200

**HA2U1, HA2U2 Sizes 28...200**

**Variation: Electrical override of pressure setting,  
with electrical valve for travel direction  
(HA.R1, HA.R2)**

On version HA1 and HA2 the high pressure related control can be overridden by means of an electrical signal to the switching solenoid b. The override causes the variable motor to swivel to its maximum angle.

Switching solenoid b de-energized  $\triangleq$  no override

Switching solenoid b energized  $\triangleq$  motor set to  $V_{g \max}$

The travel directional valve ensures that also at a change of the high pressure side (for instance travel drive at down hill operation) always the preselected pressure side of the hydraulic motor regulates the swivel angle.

An undesired swivel of the variable motor to bigger stroke volume can be avoided.

In depending of the direction (travel direction) the travel directional valve is actuated by the pressure spring or the switching solenoid a.

direction of rotation	operating pressure in	switching solenoid a
clockwise	A	energized
counter-clockwise	B	de-energized

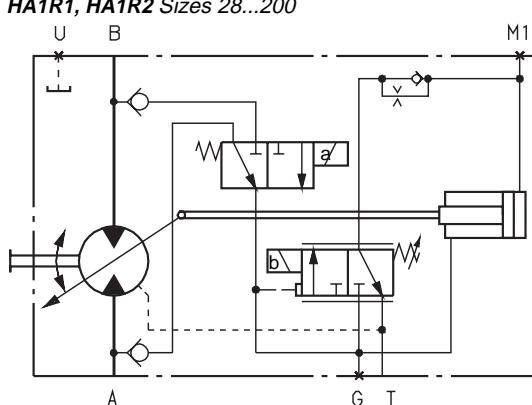

**HA.R1** switching solenoid a, b 12 V DC; 1,6 A (min.)

**HA.R2** switching solenoid a, b 24 V DC; 0,8 A (min.)

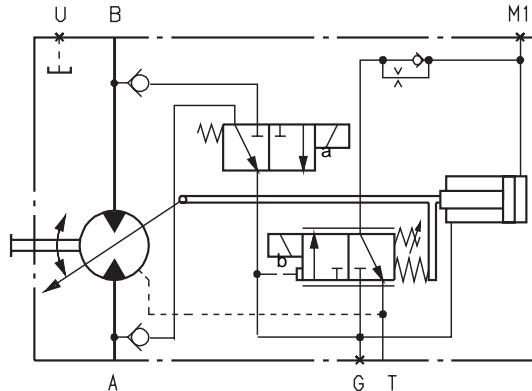

**Circuit diagram:**

**Automatic control, with electrical override and  
electrical valve for travel direction**

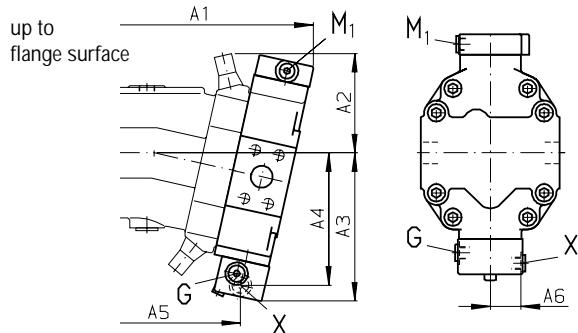

**HA1R1, HA1R2 Sizes 28...200**

**HA2R1, HA2R2 Sizes 28...200**

**Connections**

A,B	Service line ports 6000 psi (420 bar) high pressure series	SAE 2"
G	Port for synchronous control of a number of units and for remote control pressure (plugged)	M18x1,5
X	Pilot pressure port	M14x1,5
T <sub>1</sub> , T <sub>2</sub>	Case drain ports	M33x2
U	Flushing port (plugged)	M18x1,5
M <sub>A</sub> , M <sub>B</sub>	Test ports	M14x1,5
M	Test port for control pressure (plugged)	M14x1,5

## Swivel Angle Indicator

### Optical swivel angle indicator (V)

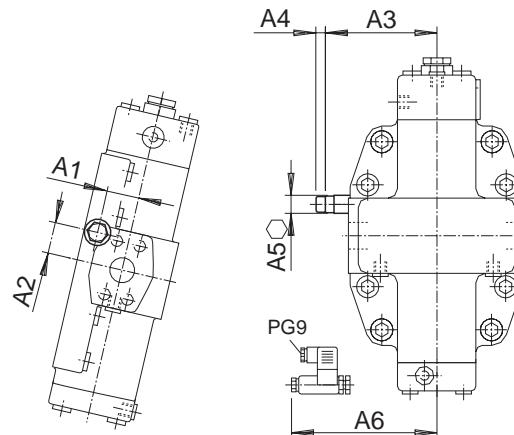

The swivel position is indicated by a pin on the side of the housing. Depending on the position of the control lens the pin is pushed out. If it is **flush with the housing** the motor is at **zero**. At max. swivel  $V_g \text{ max}$  the length of the pin is 0.31 inches (8 mm). (Display is still possible if the protective cap is removed)

### Electronical swivel angle indicator (E)

The motor position is fed back here by means of an inductive positional transducer. It converts the displacement of the variable unit into an electrical signal. The swivel position may be further processed by means of this signal, e.g. it may be fed to an amplifier card.

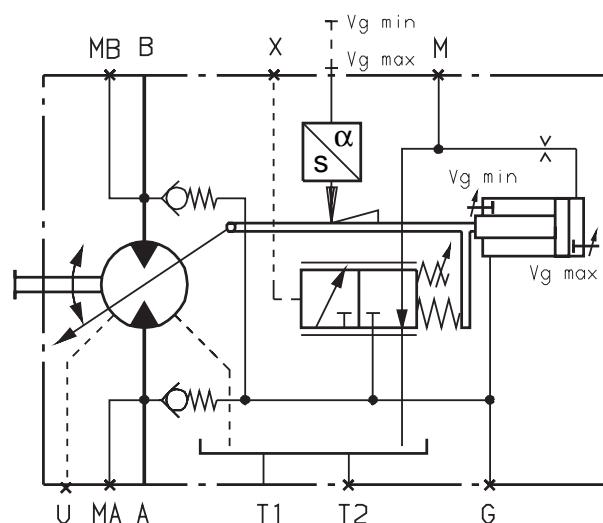

Inductive positional transducer type IW9-03-01

### Unit dimensions

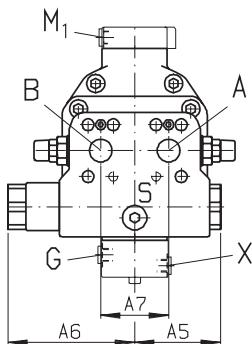

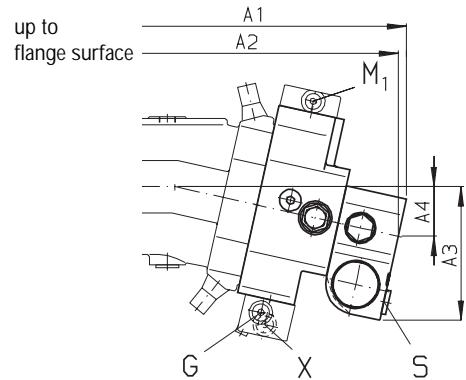

### Circuit diagram:

*Hydraulic control, pilot pressure related HD, with optical swivel angle indicator V*

Size	A1	A2	A3	A4 <sup>1)</sup>	A5 <sup>1)</sup>	A6

**Unit Dimensions - motion control valve****Port plate with pressure relief valves, for mounting a motion control valve (37, 38), sizes 55...160****Connections**

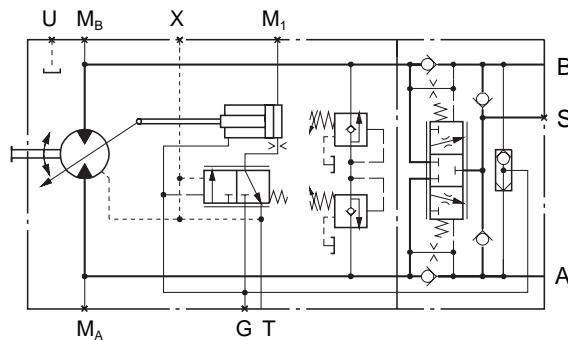

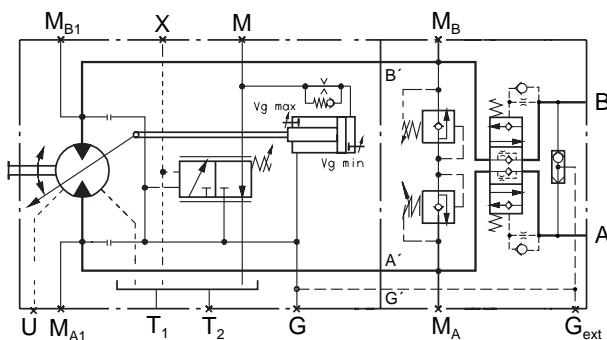

A, B Service line ports  
6000 psi (420 bar) high pressure series  
S Boosting (plugged)

suitable for mounting:

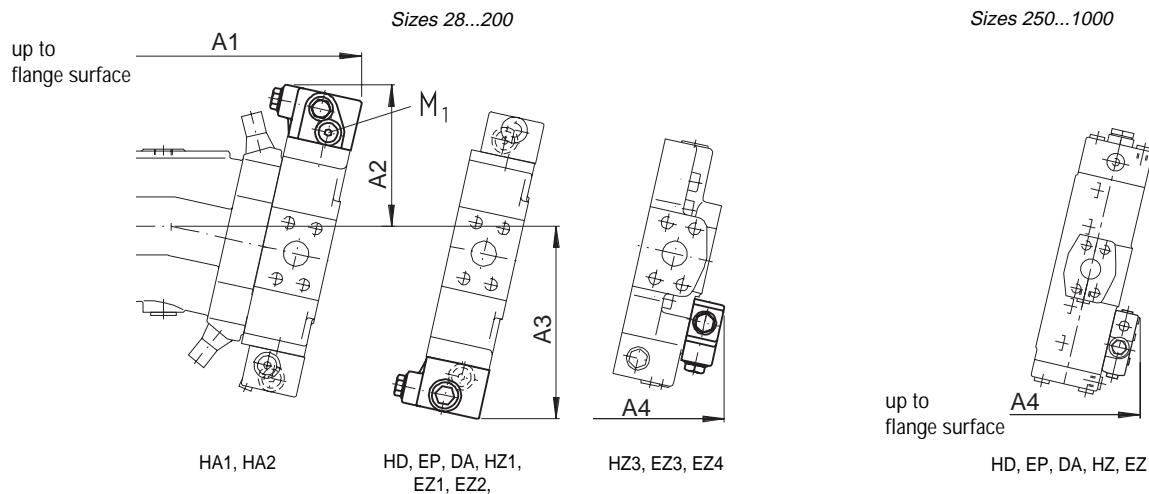

- 1 Rexroth motion control valve (see RE 64317)
  - MHB16RNP...18E (size 55, port plate 38)
  - MHB20RNP...11 (size 55, port plate 38)
  - MHB20RNP...18 (size 80, port plate 38)
  - MHB20RNP...18E (size 107, port plate 37)
  - MHB25RNP...18 (size 107, size 160, port plate 38)
- 1 Rexroth motion control valve (see RE 64316)
  - MHB30 (size 250, port plate 08)

**The motion control valve is not included in the type references, please order separately!**

(Exception: size 250, port plate 088, with mounted motion control valve)!

**We recommend total supply through Rexroth!****Sizes 55...160****Size 250**
